💼 Relevant Experience

EZ-AD TV Full-Stack Web Developer   **4/19 - Now**

Tech Stack: Vue.js, jQuery, Bootstrap, PHP, MySQL, Apache, Mac

Responsible for every aspect of the main and sister company administrative websites, including implementing all changes and debugging potential issues, for both the front end and back end:

🎓 Education

Valencia High School:	2005-07
Academy of the Canyons:	2007-09
College of the Canyons:	2009-13

- Produced pages for both administrative websites to display tables of information from our database, for a variety of uses. These pages usually contained tables of paginated data, often mapped from multiple database tables, parsed to be human readable and concise, with sortable columns and filters for applicable fields, including predictive text inputs and dropdown selections. Some of these tables contained information relying on lengthy queries that would be cached hourly through scripts to save for quicker dynamic loading. I eventually compiled all of these features into a reusable boilerplate page with documentation for convenient future use.

- Improved the company's invoicing system by adding more functionality, from editing invoices for error correction to implementing automatic late fees. Also generated email summaries of useful information such as failed auto-payments and audit reports.

- Designed an interactive weekly overview to display all employee timesheet information. The overview utilized pagination to easily jump to previous weeks and displayed detailed information about each shift and the tasks that were completed.

- Implemented the ability to reply to and a display for "non-command" responses to mass text messages sent by businesses, who were notified about customers awaiting answers to questions that were not already answered by our custom chatbot. Also assembled a similar display for technical support tickets and previous live chat logs.

- Developed a reusable Terms of Service system and pages for initializing, sending, displaying and tracking individual agreements for each business.

- Composed employee notifications for time-keeping reminders to take a lunch break and clock out before reaching overtime. Added personal timer displays for break durations and the overall time clocked in each day for convenience and better time management.

- Created timesheet violations for employees that are late, missed lunch, or reach overtime. The violations could be overridden by a manager's personal pin and are tracked in a log for future reference.

- Integrated Slack with our custom-made Trello using "slash commands" to create and send tasks while in a chat, or relay information easily from our database.

- Compiled basic SEO audits for public homepages after redesigns and fixed any issues that affected overall accessibility or website performance.

- Communicated with and directed remote developers on tasks and changes to complete. Helped them gain certain administrative or development permissions and provided local data for testing as needed.

- Performed hardware repairs for myself and other employees, was responsible for keeping backup restores up to date, and used those saved backups to set up new employee computers for use.

- Minor assistance with employee onboarding, video production, and mobile application testing.
